

Midterm Design Pitch

Pressure-test your design decisions before final implementation

Grading will be based on the presentation of ideas and the clarity of communication — it is ok if you are still figuring out technical things.

Time: ~ 7 minutes + QnA (each group).

Scope:

1. **Introduce your domain and business goal** (~1min)
2. **Processing Paradigm and Schema Design** (~2 min) OLAP or OLTP? Star or snowflake schema or something else? Draw your schema: Identify your fact table(s) and dimension tables. Explain briefly why you chose this schema for your use case.
3. **Transformation Pipeline** (2-3 min) Draw a diagram showing the flow from raw source data through to your proposed output tables. Clearly label each step with what the transformation does — for example: *clean nulls and standardize date formats* → *join orders with customers* → *aggregate to daily revenue summary* → *load into fact_daily_sales*. You do not need to have built this yet; you are proposing it. You may also propose a potential use case or end use from this pipeline, but its ok if that's still a work in progress.
4. **Early Tech Stack/Diagram** (~1 min): What tools and services are you planning to use? This can be a simple list or a diagram showing compute, storage, orchestration tools, etc.

QnA: Your group will be asked at least two questions – one by me and one by your peers.
